

FindOutFormOpen

(Q) How do I find out from code if a form is open or not?

tags:
[HowTo](#)

(R) Pass the form name to the following function. Function will return True if form is open and False if it's not.

```
Function bIsLoaded(ByVal sFormName As String) As Boolean
  ' sFormName is not case sensitive
  bIsLoaded = AllForms(sFormName).IsLoaded
End Function
```
