

## TraceLog

tags:  
[Error handling](#)

### Role

Registers in the Traces circular buffer a new entry.

### Syntax

`TraceLog(TraceLevel, Text, [MessageBox])`

### Arguments

| Argument   | Type    | Default | Description                                                                                                                                                                                                           |
|------------|---------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TraceLevel | String  |         | The level of the occurred event. See <a href="#">error handling generalities</a> for more details.<br>The call to <i>TraceLog</i> is <u>ignored</u> if the given level is lower than the current minimal trace level. |
| Text       | String  |         | Text to be recorded.                                                                                                                                                                                                  |
| MessageBox | Boolean | True    | Indicates if the Text must also be displayed to the user in a message box.                                                                                                                                            |

### Example

TraceLog some information

```
TraceLog("WARNING", "You should be more careful !!")
```

Next message will be displayed to the user if the current minimal trace level is at least "WARNING".
