Requery

The *Requery* method updates the data underlying a specified control that's on the active form by requerying the source of data for the control.

tags:
Methods

If the target is a **Form** and the source is a *Parameter Query* the parameters are re-asked to the user.

Applies to ...

Object	Description
Form	The representation of an <i>OpenOffice/LibreOffice</i> database form.
SubForm	A subset of the Controls present in a Form.
ComboBox	A combobox control.
ListBox	A listbox control.

Syntax

```
form.Requery
subform.Requery
control.Requery
```

Remarks

If the targeted object is a Form or a SubForm the *Requery* method resets the current record to the first available in the record set.

Example

Reload the content of a combo box after a database change

```
Dim ofForm As Object, ocCombo As Object
Set ofForm = Forms("myForm")
Set ocCombo = ofForm.Controls("myComboBox")
ocCombo.Requery
```
