 BOF, EOF ✕

## BOF, EOF

The *BOF* property returns a value that indicates whether the current record position is before the first record in a **Recordset** object.

The *EOF* property returns a value that indicates whether the current record position is after the last record in a **Recordset** object.

tags:  
Properties

### Applies to ...

Object	Description
Recordset	The representation of a set of records derived from a table, a query or an SQL statement.

### Syntax

`recordset.BOF`  
`recordset.EOF`

### Returned values

Boolean

### Remarks

- You can use the *BOF* and *EOF* properties to determine whether a *Recordset* object contains records or whether you've gone beyond the limits of a *Recordset* object when you move from record to record.
- If either the *BOF* or *EOF* property is **True**, there is no current record.
- If you open a *Recordset* object containing no records, the *BOF* and *EOF* properties are set to **True**, and the *Recordset* object's **RecordCount** property setting is 0. When you open a *Recordset* object that contains at least one record, the first record is the current record and the *BOF* and *EOF* properties are **False**; they remain **False** until you move beyond the beginning or end of the *Recordset* object by using the **MovePrevious** or **MoveNext** method, respectively. When you move beyond the beginning or end of the *Recordset*, there is no current record or no record exists.
- If you delete the last remaining record in the *Recordset* object, the *BOF* and *EOF* properties may remain **False** until you attempt to reposition the current record.
- Typically, when you work with all the records in a *Recordset* object, your code will loop through the records by using the **MoveNext** method until the *EOF* property is set to **True**.
- If you use the **MoveNext** method while the *EOF* property is set to **True** or the **MovePrevious** method while the *BOF* property is set to **True**, an error occurs.

## Example

---

Create a new recordset on table *Invoices* and count the records (not the most efficient way to do it ... !)

```
Const dbReadOnly = 4
Dim orsRecords As Object, lCount As Long
    Set orsRecords = Application.CurrentDb().OpenRecordset("INVOICES", , , dbReadOnly)
    lCount = 0
    With orsRecords
        If Not .BOF Then           ' An empty recordset has both .BOF and
            Do While Not .EOF
                lCount = lCount + 1
                .MoveNext
            Loop
        End If
        .mClose()
    End With
    Print "Number of records = " & lCount
```
